PYTHON

PRINT() FUNCTION

https://thehonestcoder-edu.github.io/

#DEFINITION

Syntax (A Python Fundamental)

In all programming languages, syntax refers to the set of rules that we need to follow.

Just like we we need to follow traffic rules while on the road, Similarly, we need to follow these rules while programming.

What is print()?

The print function in Python is used to display information to the user.

What can it display?

Using print(), we can display:

- Text
- Numbers

Syntax-

```
print("Your-content-here")
OR
print(57)   #Remember you can write any number/text of your choice
```

You may find parentheses and quotes intimidating at first, but the logic is pretty simple-

- Imagine the parentheses to be like an ‘input tray’, whatever you serve inside it, is printed by the function.
- The quotes mean that whatever the input is, just display it as it is. Just take this part which is in the quotes and print it straight away with no changes.

#Pro Tip

Common Mistake - Avoid!

A new print() statement always starts from a new line.
